

Clean

Renewable energy from the sun. Chlorine (Cl) is vital to the production of ultra-pure silicon needed to make solar cells. On a bright day the sun shines 1,000 watts of energy onto each square metre of the Earth's surface. Solar cells trap this energy, transforming it into electricity to heat our homes and offices in an environmentally-sound way.

For more information on the many applications of chlorine, visit www.eurochlor.org

Chlorine – an essential element of life
